#### PROJECTS SUPERVISED

1. **RoadSense: Road condition monitoring using smartphone sensors**  
 Collected dataset of mobile sensor data (accelerometer, gyroscope, GPS), camera footage (video), and CAN bus data (brake and speed data via OBD-II), and designed an AI system to automatically detect and map road surface anomalies (smooth asphalt road, speed-bumps, speed humps, pot-holes, earthen road, etc.).  
 The dataset is available at: <https://dx.doi.org/10.21227/3j8p-dc32>.
2. **Crowd queue length (counting) estimation for metro stations**  
 Developed a crowd counting and queue length estimation model and deployment over NVIDIA Jetson Nano device for real-time crowd statistics. The scope includes data collection, annotation, custom crowd model training and evaluating, model finetuning, conversion to TensorRT format, deployment over NVIDIA Jetson Nano device. Two PTZ cameras are installed after manual calibrations to collect data via MQTT, performed real-time predictions, and serve statistics to the client interface in real-time. The system was operated during the FIFA world cup matches in stadium and metro stations to estimate spectators' queues length to provide estimates for metro station resource management. The project is later integrated into QMIC's **Falcon-I** platform for smart cities.
3. **Acoustic detection and localization of noisy vehicles**  
 Collected vehicular traffic sound data, analyzed using signal processing tools (SNR, RMS, zero-crossing rate, fast fourier transform, and spectrograms). Designed a sound source localization (SSL) system to detect and localize noisy cars and motorbikes on roads using traditional techniques (GCC-PHAT, SRP-PHAT), and machine learning methods (SVM, RF, RNN, LSTM).  
 The project details are available at: <https://github.com/muasifk/TrafficSSL>.

4. **Detection of unauthorized drones in lower airspace**  
Designed a prototype for drone detection using sensor-fusion (acoustic + RF + visual), and developed an attribute-based encryption-based scheme to detect unauthorized drones in the lower-airspace. For acoustic detection, we used a ReSpeaker 4-mic array and RaspberryPi processor with Open Embedded Audition System (ODAS) GUI. For RF detection, we used E312 USRP (by Ettusresearch™) with a 2x2 MIMO transceiver. For visual detection, we used a PTZ camera WizSense series (model# SD6CE445XA-HNR), and Jetson Xavier device.
5. **Intelligent construction safety violation system (iVDS).**  
Designed an AI-based system to automatically detect safety violations (e.g., persons not wearing PPEs such as safety helmet, safety vest, safety goggles) in construction sites in Qatar. The project involves data collection, annotation, and AI modeling using YOLO, Faster-RCNN.
